

CSCI 135 Fundamentals of Computer Science I

Module 7 Problem 2: Morse Code Interpreter Lab

Morse code is a telecommunications method which encodes text characters as standardized sequences of two different signal durations, called *dots* and *dashes*, or *dits* and *dahs*. Read more here: https://en.wikipedia.org/wiki/Morse_code[Links to an external site.](#).

Use Python to write a Morse Code translator. Be able to decode letters and digits. Morse code messages should have three spaces between letters and seven spaces between words. <http://www.moratech.com/aviation/morsecode.html>[Links to an external site.](#)

Use a collection of your choosing to store characters and morse code, and write the logic to translate messages.

I am looking for a well-designed program that:

- uses good coding style;
- has clear and well-designed interaction with the user;
- is logically divided into functions that reduce redundancy and increase code readability; and
- has a straight-forward, elegant solution that makes use of existing functions and methods.
